                     mRNA in the nucleus.
-!- SUBCELLULAR LOCATION: Nuclear; nucleoplasm.
-!- SIMILARITY: Contains 3 RNA recognition motif (RRM) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            47.4%; Score 46; DB 1; Length 633; llarity 57.1%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                US-10-041-860-49

                                                                                                                                                                                                                                                                                                   ö
                                                                                                                            DNA segments encoding monoclonal antibody - which binds to gp120 and neutralises HIV, for treating AIDS, and for diagnosing and monitoring HIV
                                                                                                                                                                                     The nucleotide sequence of F105 Vk (AAQ42707 - sequence differs from other F105 Vk sequences given elsewhere in the specification) was compared with germline gene Humvk325 (AAQ42706), showing 97.7% similarity. By nucleotide sequence analysis, F105 appears to be derived from a member of the Vk III subgroup gene family. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                       9

The invention relates to an antibody to human CD40, or its functional fragment, has at least one of the following properties: acting on dendritic cells to produce IL-12 in the presence of LP8 (lipopolysaccharide) and IRNgamma (interferon gamma); acting on dendritic cells to activate maturity of the dendritic cells with high G28-5 antibody against cells to activate maturity of the dendritic cells with high G28-5 antibody against B cell line. Such antibodies or functional fragments can be used as immunoactivators, anti-tumour agents, immunosuppressants, and as remedies for autoindmene diseases, allergy or coagniation factor VIII inhibitors syndrome. This sequence represents a protein relating to the anti-CD40 monoclonal antibody of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                             The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeakt, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention

The present invention relates to anti-human Fas ligand (hFasL) antibodies or their antigen-binding portion (I). (I) are useful for preparing a composition for neutralizing FasL activity for treating or preventing a disorder in which FasL activity is detrimental, e.g. systemic inflammatory response syndrome, sepsis, multiple organ dysfunction syndrome, acute respiratory distress syndrome, trauma, graft-versus-host disease, organ rejection associated with organ transplant, multiple sclerosis, idiopathic pulmonary fibrosis, osteoarthritis, inflammatory bowel disease, Crohn's disease, ulcerative colitis, acute myocardial confinence, acute myocardial confinence, inflammatory in the inflammatory andiomyopathy, cardiac reperfusion injury, diabetes, cancer, HY infaction, influenza virus infection, hepatic disorders including but not limited to fulminant viral hepatitis B or C, chronic hepatitis C virus, chronic hepatitis B virus, alcoholic hepatitis, hepatic cirrhosis or renal disorders. The present sequence is a light chain variable region (LCVR) of anti-FasL antibodies 3El or 4G11.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ଚ
                          The invention relates to polymucleotides encoding novel human proteins or their active domains. The polypeptides, polymucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the abstrant protein.

CC expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides.

CC Polymucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a ctumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein cumour, as a statem markers, and to isolate receptors or ligands.

CC levels, as tissue markers, and to isolate receptors or ligands.

CC disorders, stem cell disorders, regenerating bone, cartilage, tendon, clampant and/or nerve tissue, wound healing, treating puris, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, allered to stems at the anaemia, and solarosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, graftverminer's parkinson's and shemophilia, thrombosis, auti-inflammatory diseases, casen, and infection. The present sequence crepters or represents a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunomodulatory, cytostatic, meuroprotective, vulnerary, nootropic, anticonvulsant, antiarthritic, cerebroprotective, antifungal, antiaviral, antibacterial, antiallergic, dermatological, haemostatic, antiathmatic, thrombolytic, immunogen, antibody, gene therapy, neurological disorder; Parkinson's disease, inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder.

The invention relates to polymuclectides encoding novel human proteins or their active domains. The polymetides, polymuclectides and antibodies cataled against the polymetides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein of expression or activity. The polymetides can be used as molecular weight expression or activity. The polymetides can be used as molecular weight or expression or activity. The polymetides can be used as probes and primers, for markers, food supplements, and in antibody production. The polymetides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polymetides of the invention can be used to target drugs to a therapy, polymetides of the invention can be used to target drugs to antibodise/alicit an immune response, to determine quantitative protein can be used to target drugs to antibodise/alicit an immune response, to determine quantitative protein can be used to target drugs to antibodise/alicit an immune response, to determine quantitative protein can be useful in treating platelet company describes, treating, and its generating one, carrilage, trendon, cligament and/or nerve tissue, wound healing, treating burns, promocing the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporoals and osteoarthritis, anamemia, chingament infaction or from autodimmunity, cancer, allergy, asthmy grand disease, eczema, haemopolia, attromosty disease, nervous system disorders, and infection. The present sequence con represents a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           170 EIVLTQSPGTLSLSPGERATLSCRASQSVSSSYLAWYQQKPGQAPRLLIYGASSRATGIP 229

The invention relates to polymucleotides encoding novel human proteins or their active domains. The polymeptides, polymucleotides and antibodies caised against the polymeptides are used in a method of treatment of a manmal and prevention of disorders caused by the aberrant protein care used supplements, and in antibody production. The polymeptides are used as molecular weight are used to identify compounds which bind to the polypeptides.

CC dequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in generating for chromosome or gene mapping, in the production of the recombinant proteins, and in generating anti-sense DNA or RNA and in generating believes, elicit an immune biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands.

CC polymeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, cligament and/or nerve tissue, wound healing, treating burns, promocing contraceptive, treating osteoporosis and osteoarthritis, and an experial or fere proliferation or fiferentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis aneamia, cligaments, so parkinson's and Huntington's diseases, amylotrophic lateral cliesaes, nervous system disorders, and infection. The present sequence represents an orders, and infection. The present sequence
                                                                                                                                                                                                                                                                                                      Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage.
                                                                                                                                                                                                                                                                                                                                                                         Example 4; Page 824-825; 894pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diseases, nervous system disorders, ar

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies are assed in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein carposession or activity. The polypeptides can be used as molecular weight expression or activity. The polypeptides can be used as molecular weight care used to identify compounds which bind to the polypeptides.

CC sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-ense DNA or RNA and in generating combinant proteins, and in generating anti-ense DNA or RNA and in generating combinant proteins, and in generating anti-ense DNA or RNA and in generating complexed, as tissue markers, and to isolate receptors or ligands.

CC tumour, in assays to determine biological activity, to raise threapy. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, classacers, stem cell disorders, regenerating bone, cartilage, tendon, cligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, chingament's, parkinson's and Huntingfon's diseases, may infection or from autoinmounty, cancer, allery, asthma, graft-coversue-host disease, eczema, haemophila, thrombosis, anti-inflammatory diseases nervous system disorders, and infection. The present sequence thrombolytic; immunogen; antibody; gene therapy; neurological disorder; Parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder. Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage. WPI; 2003-598476/56. N-PSDB; AAD57371 New human monoclonal antibody that binds to human CD10, useful for treating or preventing tumor or autoimmune disease, e.g., rheumatoid treating on arthritis.

Claim 18; Fig 8; 122pp; English.

The invention relates to human monoclonal antibody that binds to human CD30. The antibody is useful for treating or preventing tumour or autoimmune disease e.g. rheumatoid arthritis, systemic lupus erythematosus, systemic sclerosis, atopic dermatitis, Grave's disease, flashimoto's thyroiditis, Wegner's granulomatosis, Omen's syndrome, chronic renal failure, acute infectious mononucleosis, herpes or HIV (human immunodefaciency virus) virus-associated diseases. The antibody is also useful for treating Hodgkin's disease, anaplastic large cell lymphoma (ALCI), andioimmunoblastic lymphoma (ALCI), adult T cell lymphoma (ATL), angioimmunoblastic lymphoma (ALCI), adult T cell lymphoma (ATL), angioimmunoblastic lymphomas, embryonal carcinomas, undifferentiated carcinomas of the himo-pharynx (e.g. schmincke's tumour), castleman's disease, Kaposi's Sarcoma and other T-cell or B-cell lymphomas. The present sequence is human CD30 antibody VL (light chain variable domain) protein

Hoogenboom HRJM, Reiter Y;

WPI; 2003-663847/62. N-PSDB; ADA89267 New protein comprising an immunoglobulin heavy chain variable (VH) domain and an immunoglobulin light chain variable (VL) domain, useful for preparing a composition for treating or preventing a cancerous disorder.

Disclosure, Fig 27A, 224pp, English.

The present invention describes a protein comprising an immunoglobulin (Ig) heavy chain variable (WH) domain and an Ig light chain variable (VL) domain. The protein blinds a complex comprising a major histocompatibility complex. (MHC) and a peptide, does not substantially bind the MHC in the absence of the bound peptide, and does not substantially bind the peptide in the absence of the MHC. The peptide is a peptide fragment of gp100, MUC1. TAX or hTERT. Also described: (1) a pharmaceutical composition comprising the novel protein and a carrier; (2) a cytotoxic T cell comprising one or more nucleic acids for expressing the Ig that binds a complex having an MHC and a peptide, and does not substantially bind the MHC in the absence of the bound peptide, and does not substantially bind the comprising a first segment that macodes the Ig variable domain; (4) a host cell comprising heterologous nucleic acid sequences that encodes the comprising a first segment that encodes the Ig variable domain; (4) a host of protein; (5) a transgenic animal whose genome includes heterologous nucleic acid sequences that encode the protein; (6) identifying the protein; (8) ablating or killing a target cell that an austigen-binding protein; (8) ablating or killing a target cell that can a surface MHC molecule; (9) treating or preventing a cancerous disorder in a subject; and (10) detecting an MHC-peptide complex in a semple. A protein of the invention has expected a cell for nreparing a complex in a semple. The present and can be used in gene therapy. The protein is useful for preparing a composition for treating or preventing a cancerous disorder. The present sequence represents the light chain of an antibody which binds to an Mi peptide complex where the peptide component in as peptide fragment of

The present invention describes antibodies or their functional fragments that bind to TRAIL-R1 and/or TRAIL-R2. TRAIL-R1 and TRAIL-R2 antibodies have cytostatic and apoptotic activities, and can be used in antibody therapy. The antibodies can be applied as remedies and preventives of diseases due to cells expressing TRAIL-R1 and TRAIL-R2, which are useful in the therapy of malignant tumours. Remedies produced with the sequence represents an anti-TRAIL-R1 and TRAIL-R2, which are useful sequence represents an anti-TRAIL-R antibody amino acid sequence from the present invention

The invention relates to an isolated human monoclonal antibody which binds to human CD89 (an IgA receptor also called Fcalpha), comprising the least one characteristic selected from: (i) a binding equilibrium cleast conscioution constant (K a) to human CD89 of at least about 10^7 M^-1; (ii) a dissociation constant (Kd) from human CD89 of about 10^-88^-1 or less; (iii) absence of in vivo complement activation upon binding to the man CD89; (iv) the antibody binds to an epitope on human CD89 which does not inhibit human IgA binding to the receptor; and (v) the antibody complises heavy chain and light chain components and their encoding nucleic acids appearing as ABS2470-ABS3473 and ABG3211 -ABG32114. The human antibodies of the present invention that modulates CD89 levels, blocks or inhibits IgA binding to CD89 are useful in the treatment of complexes such as cancer, bacterial, viral and parasitic infections, autoimmune diseases (diabetes, arthritis, multiple sclerosis, psoriasis, crohn's disease, asthma, and allergies), chronic hepatitis. Hench-schooling of the present sequence represents the light chain variable region of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 10; Fig 4; 82pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         monoclonal antibody CD89 8.2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 109 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diseases.
```

useful as

New isolated human monoclonal antibody that binds to human CD89, for in the treatment of diseases related to CD89 expression such cancer, bacterial, viral and parasitic infections and autoimmune

```
the present invention describes a method for detecting an analyte in a human sample containing human antibodies that specifically bind to antibodies from a nonhuman species. The method involves contacting the ample with a human antibody (I) which specifically binds to antibodies from a nonhuman species and detecting the binding between (I) and the analyte to indicate presence of the analyte. The method is used for detecting an analyte in a human sample containing human anti-mouse antibody (HAMA) (preferably human anti-mouse idiotype antibodies and/or that cause human diseases e.g., hepatitis (A,B and C), influenza, Herpes, type of target antigen including bacterial, fungal and viral pathogens that cause human antibodies can be used as detection reagents for performing claims, Leishmania, Staphylococcus aureus, Steudomons acruginosa. Human antibodies can be used as detection reagents for performing claims all diagnostic tests and for performing other in vitro detection assays, including for research purposes. (I) can be used in qualitative assays designed to indicate the presence of one or more target antigen in a sample that usually correspond to the sensitivity limitations of the assays for each target antigen. Also, (I) is used to determine the amount of target antigen in a sample in a semi-quantitative or relative sense. Contarget antigen in a sample in a sample or antigen in a sample carried out using (I). AM441652, and AAB99361 to AAB93399, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting analyte in human sample containing human antibodies binding to nonhuman-antibodies, involves contacting sample with human antibody which binds to antibodies from nonhuman species and detecting binding.

the present invention describes a method for detecting an analyte in a human sample containing human antibodies that specifically bind to antibodies from a nonhuman species. The method involves contacting the sample with a human antibody (I) which specifically binds to antibodies from a nonhuman species and detecting the binding between (I) and the analyte to indicate presence of the analyte. The method is used for detecting an analyte in a human anti-mouse idiotype antibodies and/or heterophilic antibodies). The method can also be used for detecting any type of target antigen including bacterial, fungal and viral pathogens that cause human diseases e.g., hepetitis (A,B and C), influenza, Herpes, CC diardia, Malaria, Leishmania, Staphylococcus aureus, Pseudomonas that cause human antibodies can be used as detection reagents for performing clinical diagnostic tests and for performing other in vitro detection assays including for research purposes. (I) can be used in qualitative assays designed to indicate the presence of one or more target antigens above minimally detectable amounts of antigen in the sample that usually correspond to the sensitivity limitations of the assays for each target antigen. Also, (I) is used to determine the amount

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method (M1) for producing a human antibody phage display library (I), comprising: (I) providing a nonhuman transgenic animal (II) whose genome comprises human immunoglobulin genes; (2) isolating nucleic acids encoding human antibody chains (III) from lymphatic cells; and (3) forming a library of display packages whose members comprise a nucleic acid encoding (III) which is displayed from the package. The method is used for producing a human antibody display library, e.g., a Fab phage display library. The display method may be used to green nucleic acids encoding antibody chains obtained from the correct nucleic acids encoding antibody chains obtained from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunised nonhuman transgenic animals, and from this a population of antibodies may be prepared. Production of a human monoclonal antibodies display library using this method means there is no need to immunise humans with antigens, and the difficulties faced with immortalising B cells are avoided. AAH29958 to AAH30066 and AAB74994 to AAB75056 represent sequences used in the exemplification of the present invention
of target antigen in a sample in a semi-quantitative or relative sense. Quantification of one or more target antigens in a sample can also be carried out using (I). AMH1612 to AAH41686, and AAB99361 to AAB9939, represent sequences used in the exemplification of the present invention

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                  US-10-041-860-49

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                            US-10-041-860-49
